

Installed externally, solar protection systems offer optimum performance in terms of thermal comfort. The Soltis® 86, 92 and 93 textile ranges are designed to ensure ever greater protection from heat and sunlight for buildings and their occupants. They constitute a true heat shield, which contributes to preserving a constant **internal ambient temperature** and they render a building sensitive to temperature differences hour by hour throughout the day, whilst considerably enhancing its quality of life and internal atmosphere. Soltis® textiles therefore enable us to **reduce energy and operating costs for the building, to which they are fitted. They boast remarkable dimensional stability and unmatched resistance to the weather, UV radiation and tearing.** The structural characteristics of Soltis® 86, 92 and 93 textiles explain their growing success with architects, engineers and building professionals for external applications.

Thanks to their **extensive colour range**, Soltis® 86, 92 and 93 fabrics guarantee harmonious, aesthetic cladding and protection of building facades; in this way, solar protection systems become an **architectural extension of the building.**

## SUSTAINABLE DEVELOPMENT

The durability and weight characteristics of Soltis® textiles represent natural contributions to sustainable development strategies. Moreover, Soltis® fabrics are 100% recyclable through the Texyloop® process. They are covered by a so-called “Fiche de Données Environnementales et Sanitaires” (FDES) [health and environmental safety datasheet] and are subjected to Life Cycle Analysis (LCA), conducted and monitored by independent outside bodies; these quality indicators have clearly demonstrated their eco-efficiency.
